SPT currently employs 20 people, having either a professional screen printing or chemical background in their professional vitae. Besides of sales and distribution of the brands represented and the products sold in the scope of stencil materials, screen cleaners and screen chemicals, we focus on highly qualified technical consulting for our screen printing customers and our trade partners within our sales territory.

In our main location in Appiano Gentile, as well in the SPT premises in Heidelberg we operate a technical center, where we train our customers and distributors, thus sharing our experience and providing hands-on information.

All products are supplied from our central warehouse in Heidelberg to our global customers.
We are looking forward to the cooperation with you.

DEGREASERS

2

The preparation of the stretched screens before stencil making is one of the most underestimated processes in the workflow of a screen printer. But: the very limited effort to prepare a screen properly before coating it with screen emulsions or applying capillary films has an immediate return: when using one of our degreasing or mesh preparation chemicals you'll be on the safe side.

- VARIOPREP 3030** Degreaser concentrate 1 : 10. For manual application. Removes quickly and efficiently dirt, dust and greasy residues on all mesh types and thus ensures and excellent adhesion of the stencil materials to be applied further in the process. Biodegradable. Colour: blue.
- VARIOPREP 3031** Degreaser concentrate 1 : 30/50. The product is biodegradable
FOTECHM 30031 and has only a very slight foaming effect. It is thus suitable for automatic screen treating equipment. Its colour is slightly reddish.
- VARIOPREP 3080** Mesh-preparation concentrate, miscible 1 : 5 with water. Perfect for the preparation of screens where a capillary film is applied as stencil material. The product is biodegradable and has only a very slight foaming effect. It is thus suitable for automatic screen treating equipment. Colour: ochre.
- VARIOPREP 3101** A water-soluble degreasing concentrate, formulated for manual application and use in automatic reclaiming machines for surface wetting, especially for stainless steel and nickel mesh.
- FOTECHM 2033** A special degreaser concentrate, supplied in a slightly gel-type state. As such it allows the user to produce a liquid mesh degreaser in a very economical and easy-to-be-applied way. Mixing ratio 10 : 1.
- FOTECHM 2003** FOTECHM 2003 is a slightly alkaline ready-to-use degreasing solution, which removes dirt, dust and grease residues from the surface of the fabrics. Suitable for all types of mesh, either new or used.
- FOTECHM 2002** Non-hazardous flow-enhancer, combined with a degreasing solution for direct emulsion coating. FOTECHM 2002 is a ready-to-use gel to be applied by brush or coating trough.
- FOTECHM 2023** FOTECHM 2023 is a slightly alkaline abrasive/degreaser gel. It provides a better wetting of the mesh surface and improves adhesion of all types of stencils, especially on new mesh. A second degreasing step with this product is not necessary.
- FOTECHM 2025** FOTECHM 2025 is a ready-to-use gel of brownish colour. It helps to form a water film on the degreased mesh to allow a smooth and uniform application of all FOTECAP capillary films. The use of FOTECHM 2025 avoids pinholes after the transfer of the capillary film. FOTECHM 2025 is an absolute „must use product“, when working with capillary films.
